

Computer Vision System
Enabling machines to perceive,
understand and make decisions
from visual information

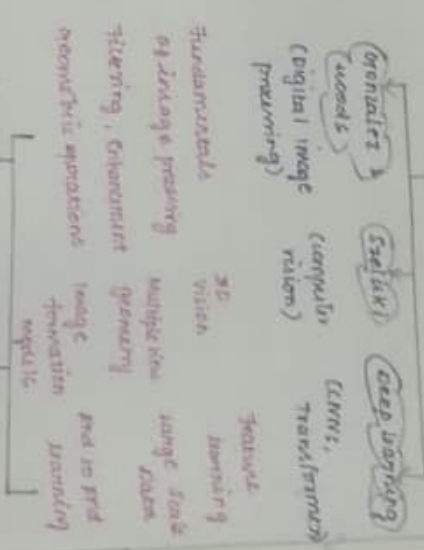

1. Systems capabilities
The foundation that determines
what can be seen and how well
it can be understood.

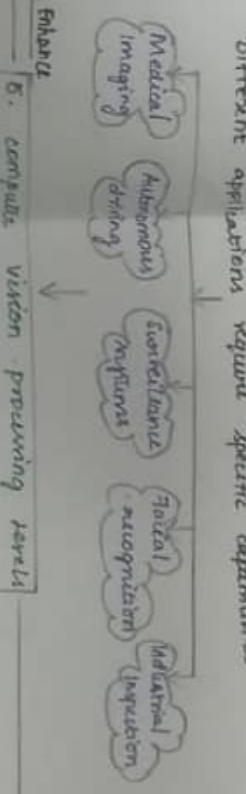

2. Image formation & Acquisition
From real world to digital representation

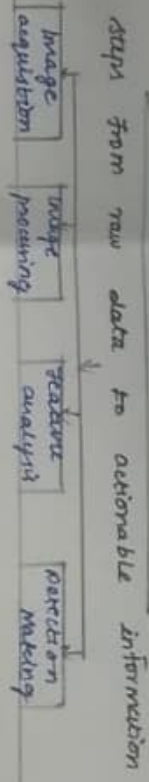

3. Iterative perspectives
Research foundations driving advances

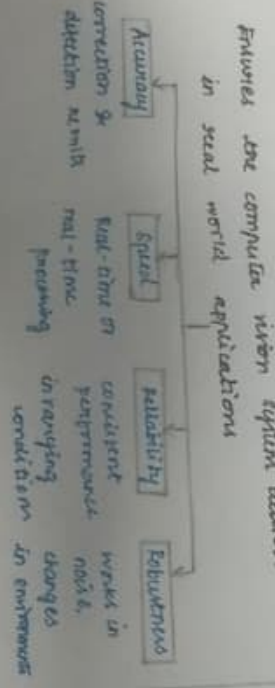

4. Vision-based Application solution
Different applications require specific capabilities

5. Computer vision processing levels

6. System performance & applications
Ensures the computer vision system delivers value
in real world applications

AI/Machine Learning supports
